Trans. of Erdöl und Kohle (West Germany) 1957, v. 10,
no. 7, p. 433-441.

Methods are described by means of which multi-constituent mixtures such as occur in petroleum oils and in fuels and lubricants obtained by hydrogenation can be characterized by just two characteristic constants, the density and the index of refraction. The method thus broadly meets the requirement of the industrial chemist for controlling the course of production by a quick, simple means which make minimum demands on the technical personnel. Nomograms for the evaluation of specific industrially-produced fractions are included.
